Abstract – A total of 2,223 Chinook salmon, 1,388 coho salmon, 785 steelhead and 192 brown trout were examined during fall 2014 and spring 2015 at the Root River Steelhead Facility (RRSF). A total of 1,127 coho were spawned, and approximately 1.13 million eggs were collected for our hatcheries.

The spring 2015 return of steelhead was down from 2014 but was 29% higher than the 10 year average return. A total of 375 steelhead were spawned, which produced about 326,000 chambers creek eggs and 328,000 ganaraska eggs.

The number of fish captured at RRSF is a subset of the seasonal migration in the Root River. RRSF does not stop every fish in the river, as they are able to move upstream past the facility before it is operational in early spring and fall, and some fish are able to bypass the facility during the sampling season when the river is at high flows.

Due to Viral Hemorrhagic Septicemia (VHS) protocols, no skamania strain steelhead brood fish have been collected from RRSF since fall 2006. Historically, adult skamania were transported in the fall from RRSF to Kettle Moraine Springs State Fish Hatchery, where they were held until they were ready to spawn the following January/February. VHS rules now prohibit the transfer of live fish from RRSF to a hatchery, and therefore, the skamania program has been suspended with none stocked since 2008. Without skamania brood stock collection, RRSF is operated later in the fall, allowing Chinooks to migrate upriver past the facility early in the season. This accounts for lower numbers of fish processed at RRSF in recent fall seasons.

In fall 2014 at RRSF the standard weight of a 30 inch Chinook salmon was 9.0 pounds, which was slightly lower than fall 2013 (9.6 pounds), but higher than the fall of 2012. The standard weight for a 22 inch coho salmon was 3.5 pounds, for a 22 inch steelhead was 3.3 pounds, and a 20 inch brown trout was 4.1 pounds.

The following tables and figures report the results of data collected at the RRSF during fall 2014 and spring 2015. These data contribute to a long-term index of Chinook, coho and steelhead populations in the Root River, and are collected to fulfill three objectives: 1) track the abundance of salmonid returns, 2) measure growth and condition of each species and/or strain, and 3) estimate return rate of each species. For complete description of methods and calculations, see Thompson and Eggold (2007).

Table 9. Average length (inches) and weight (pounds) at age (± 1 SD) of fall-run skamania-strain steelhead at the Root River Steelhead Facility during 1996 to 2012. No Skamania were captured in Fall 2013 or 2014. Data from 2000 - 2004 were taken from fish transported and held at Kettle Moraine Springs Hatchery, so some weight loss likely occurred.

Table 12. Population estimates for Chinook, coho and steelhead returning to the Root River during spring 2003 through spring 2015. Population estimates were not calculated in fall 2011, 2012, and 2014 and spring 2012 and 2015 due to a lack of recaptured fish. Fall steelhead are mostly skamania, but also include other strains.

APPENDIX A. ROOT RIVER STOCKING NUMBERS

Table A-1. Number of fingerling Chinook salmon stocked in the Root River during 1994 - 2015. Chinook salmon were marked with an oral dose of Oxytetracycline (OTC) during 2001 and 2006 - 2010. Totals for 1999, 2006, and 2013 represent reductions in statewide stocking quotas, and the totals for 2007 - 2015 represents a reallocation to decrease Chinook stocking by 33,000 in the Root River in order to increase coho by 33,000.
